Extreme events impacting the Caribbean region

Josefina Olascoaga (University of Miami)
Gustavo Goni (NOAA/AOML)

Ocean and atmospheric variability in a wide range of time and spatial scales are linked to changes in the ocean, weather, ecosystems, and fisheries.

Communities in the Caribbean region are specially vulnerable to events such as hurricanes, sea level changes, coral bleaching, sargassum inundation, etc.

This MS opportunity leads towards assessing how changes in the ocean environment are linked to extreme events in the Caribbean region.
